CN 03/26/2013 Clinic Note

03/26/2013

CO-MANAGED NOTE FOR SHARED SERVICE : I saw this patient with my midlevel provider. Please see a separate note dictated on the same date that provides the details of history, exam findings and assessment. I personally verified pertinent aspects of the case, reviewed not only the radiology reports but also the actual imaging studies, and formulated the assessment and plan. I personally discussed the findings and the plan with the patient who agrees to proceed according to my recommendations.

In summary, this is a 30-year-old male with multifocal angiosarcoma with possible involvement of left lung (lingula status post resection), left hilar node(status post resection), subcarinal node (status post resection), left 12th rib (indeterminate), pleural implant (atypical focus of spindle cells, pathology February 27 2013). Patient has been treated in the past with Adriamycin/ifosfamide followed by gemcitabine/docetaxel along with surgery for removal of all visible disease. Plan on starting the patient on paclitaxel 80 mg per meter squared on a weekly basis. Sample orders have been provided. Patient will return for followup in 8 weeks. He will have a CT of the chest abdomen and pelvis done at that time.

I spent a total of 40 mins. with the patient, of which more than 50% was spent in counseling and/or coordination of care.
